
MIE1517 Project Selection

Introduction

Once you have formed a team, you should brainstorm ideas for what your project topic should be or select/modify one of the suggested projects. Before selecting your project, you should be able to demonstrate that you:

- Know what the goals and motivations for your project are.
- Know what dataset you will use to train your model.
- Have a rough idea of the type of neural network(s) you will use.
- Have a rough idea of the related work that you can build on.
- Have a reasonable idea of how you will measure success of your project.
- Have a clear idea of how you will work together, and how to distribute work fairly.

Expectation

Once your team is set up you will be required to complete the Quercus Assignment titled “Request for Project Approval”.

As part of the submission you will be asked to provide your team number, team members’ names and a short 3-4 sentence description of the project idea you wish to work on. The dataset(s) that you plan on using, the number of samples available, and how you plan to obtain new samples and demonstrate the capabilities of your model.

How to Submit

Submit your team project proposal on Quercus by the project proposal deadline. Any work that is submitted after the deadline will receive a 20% grade deduction. Proposals submitted 24 hours past the deadline will not be accepted and will result in a grade of 0. Quercus submission time will be used to determine late submissions. You can submit your work as many times as you want before the deadline. There is a half-page limit for the main text and unlimited sources may be added to the list of references.

If any submission exceeds 1 page, a 100% penalty will be applied.

Rubric

This component of your grade will be assessed with a score of 0-1. The teaching team will review each submission and respond with “your project has been approved” or with some suggestions on how to modify the project to meet the requirements.
