
MIE1517 Final Report

Introduction

A large part of this course is focused on learning by doing and learning from each other. The final project deliverable is a step-by-step walkthrough that highlights all the steps from data loading to implementation and prediction on new data. This submission does not need to show all the work done on the project, only the steps required to prepare and demonstrate a working model along with an emphasis on any insights gained on your project journey.

The final report is a continuation of the progress report and is meant to be a guide for a fellow classmate to reproduce (and understand) the key items of the project from beginning to end.

The submission should be easy to read and include the following:

- A brief description of the project supported with a single illustration/diagram
- Data loading and any processing performed (shared link to the dataset(s))
- Brief visualization of the dataset
- Model architectures accompanied by an illustration/diagram
- Quantitative Results (i.e. learning curves, accuracies, etc.)
- Qualitative Results (i.e. interesting findings supported by examples/outputs from your model)
- Example of implementation on new data
- Summary of related work with citations/references (i.e. results on comparable projects, links to publications, etc.)
- A brief discussion of the overall results. Do you think your model is performing well? Why or why not? What is unusual, surprising, or interesting about your results? What did you learn? Any great insights obtained from working on this project?

The guide should be written in a way that someone new to your project can easily follow along with the choices you made and reproduce your results. Do not include everything you have tried and tested, the project walkthrough should be concise and easy to read.

Expectation

The expectation is that you submit a .html (or .zip) file with everything required to run your code. You do not have to create a separate report. You only have to provide an organized, easy-to-read, Jupyter notebook providing a step-by-step guide to completing the project from start to end. As part of the submission please include a link to the code on GitHub or Google Collab. A couple of samples from the dataset can be included, however, the entire dataset should be provided through a shared link to keep the files small.

Approximately half of the grade will come from including all the key points listed above and how well the walkthrough is organized. The other half will be based on the performance on new data and a discussion of the results and insights gained from completing the project.

A great example of what your report should look like is the [image colourization tutorial provided by Moein Shariatnia](#).

How to Submit

Submit your final report as a group on <https://q.utoronto.ca> by the due date. Any work that is submitted up to 24 hours past the deadline will receive a 20% grade deduction. No other late work will be accepted. Quercus submission time will be used. You can submit your work as many times as you want before the deadline.

Rubric

The grade breakdown for the progress report is outlined in the table below.

Component	Score	Weight
Results Achieved	10pt	2.5%
Discussion and Insights Gained	10pt	2.5%
Organization and Conciseness	10pt	2.5%
Reproducibility	10pt	2.5%
Total	40pt	10%
